

SentryOne Test

Secure, Cloud-Based Data Testing

SentryOne Test is a secure, cloud-based test automation framework that helps data professionals and developers test and validate data from disparate sources across the entire data lifecycle—from development through production.

Stop questioning your data

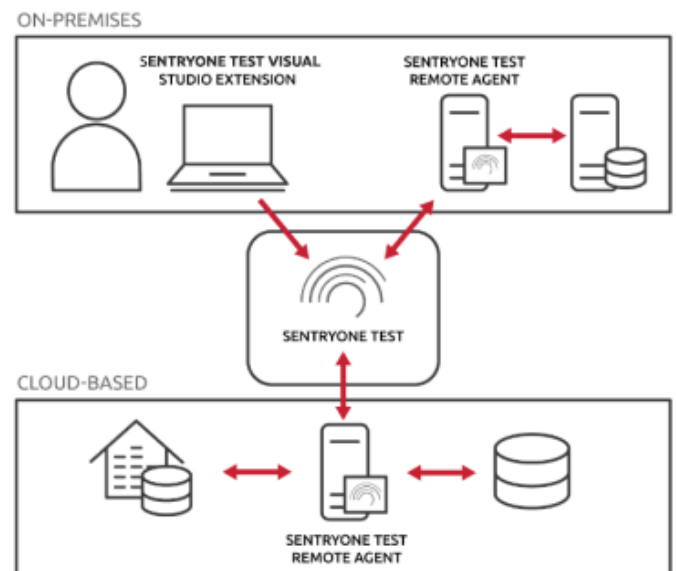

According to recent research from Forbes and KPMG, 84% of CEOs are concerned about the quality of data they're basing their decisions on. Bad data costs businesses more than \$3 trillion each year.

Isn't it time you trusted your data?

With SentryOne Test, you can test and validate data from disparate sources at any point in the data lifecycle.

- Gain confidence in your data with an industry-standard framework that builds on the power of MSTest and NUnit
- Conduct actionable tests, with the ability to schedule test runs
- View test success metrics and data behind test failures in the SentryOne Test dashboard

Use SentryOne Test to validate data during application development, ETL processes, and Master Data Management (MDM), or for verifying data in production databases.

SentryOne Test includes 1) a remote agent that enables distributed test execution, 2) the LegiTest Visual Studio extension, and 3) the SentryOne Test web portal, which enables you to deploy test projects and then programmatically call them as needed.

How you can use SentryOne Test

You can use SentryOne Test to validate data at any point of the data lifecycle, from development through production, ensuring confidence in the data that your company uses to make strategic decisions and support business functions.

Application development

SentryOne Test ensures that the data in applications you build remains valid despite application changes. Built on unit testing industry standards, SentryOne Test validates both reference and output data during development.

ETL processes

SentryOne Test enables an agile approach to validating data in Extract, Transform, Load (ETL) processes, reducing the effort required by ETL and BI developers for data maintenance as business requirements change.

Master Data Management (MDM)

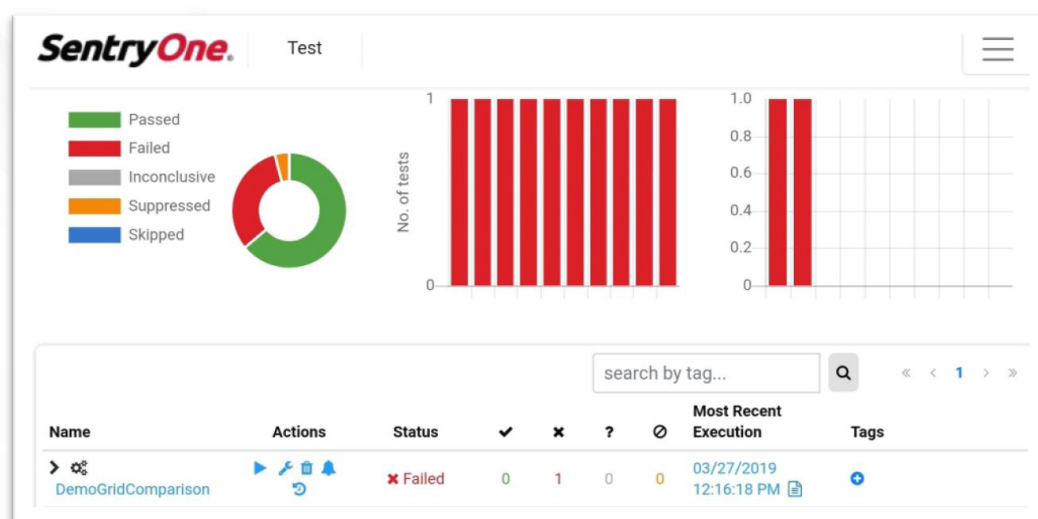

SentryOne Test facilitates MDM validation and ensures that data reaches users in the correct state and that your business is complying with data privacy regulations such as GDPR.

Production databases

For ongoing validation of production data, SentryOne Test lets you write and publish tests so that data owners can identify validation issues early, fix the data in the source systems, and manually re-run the tests.

Start trusting your data

SentryOne Test empowers developers, data pros, and power data users to continuously ensure that the data driving your business decisions is accurate. Want to see it in action? Contact our team today at sales@sentryone.com.

The SentryOne Test web portal contains dashboards that display test activity across all the projects that are deployed and have been configured to publish data to the SentryOne Test service. From the main dashboard, you can then drill down into the test failures and see exactly why tests are failing, including the data behind the test.
